[q]Differential survival is what generates adaptation. Compare this case of natural selection to what happens during artificial selection. If you were a shepherd breeding sheep for superior wool, you'd select those sheep in your herd with the best wool, and have them breed with one another to create the next generation. You'd prevent sheep with poor quality wool from breeding, and the most likely way you'd do that would be to kill those sheep...and eat them (or sell the meat to others).

A complex adaptive system is a system in which a perfect understanding of the individual parts does not automatically convey a perfect understanding of the whole system's behavior. In complex adaptive systems, the whole is more complex than its parts, and more complicated and meaningful than the aggregate of its parts. The study of complex adaptive systems, a subset of nonlinear dynamical ...
