The new dimension to be emphasized is the emerging technologies for preservation of foods and the need for sound base of information to be developed as inputs for systematic process design. The focus of the work is on process design, and emphasizes the need for quantitative information as inputs to process design.

**Food Preservation Process Design (Food Science and ...**

The focus of the work is on process design, and emphasizes the need for quantitative information as inputs to process design. The concepts presented build on the successful history of thermal processing of foods and use many examples from these types of preservation processes. Preservation of foods by refrigeration, freezing, concentration and dehydration are not addressed directly, but many of the concepts to be presented would apply.

## **Food Preservation Process Design - 1st Edition**

Preservation process is to ensure food product safety or acceptable levels of product spoilage; the impact of the process on product quality attributes has received increasing attention. Process optimization refers to defining the process needed to ensure product safety or acceptable spoilage rate, while providing a maximum retention of a product quality attribute.

Food preservation is one of the most important inseparable parts of human life. To increase the shelf-life of the food products, application of various methods such as drying, storage in vinegar under acidic condition, canning, freezing, fermenting, dry salting, curing, smoking, and sealing have been suggested.

## **Food Preservation - an overview | ScienceDirect Topics**

Food preservation, any of a number of methods by which food is kept from spoilage after harvest or slaughter. Such practices date to prehistoric times. Among the oldest methods of preservation are drying, refrigeration, and fermentation. Modern methods include canning, pasteurization, freezing, irradiation, and the addition of chemicals.

It is worth distinguishing between the preservation of raw food and the preservation of food that has already been cooked. Cooking food destroys some essential nutrients such as vitamin C, it kills off enzymes present in the food and it kills off beneficial bacteria. This is not to say that cooked food is bad and...
