Network theory is a theory for analysing graphs that represent systems containing discrete objects, with lines between the objects denoting their interactions. Such graphs are commonly used in finance - for example, to understand financial flows and interconnectedness between central counterparties. Mathematical methods from graph theory can be used to analyse networks.

We are enamored by risk models, mathematic algorithms, equations and formulae. As a matter of fact, we have become so enamored by complex mathematical algorithms, formulas, models and derivatives that we have abdicated much of the analysis of risk, to these complex formulas and quantitative analysis methodologies touted by firms far and wide.

The present volume gives an introduction of basic concepts and methods in mathematical risk analysis, in particular of those parts of risk theory that are of special relevance to finance and insurance. Describing the influence of dependence in multivariate stochastic models on risk vectors is the main focus of the text that presents main ideas and methods as well as their relevance to practical applications.
