GSM radio frequency optimization (GSM RF optimisation) is the optimization of GSM radio frequencies. GSM network consist of different cells and each cell transmit signals to and receive signals from the mobile station, for proper working of base station many parameters are defined before functioning the base station such as the coverage area of a cell depends on different factors including the ...

GSM Radio Frequency optimization - Wikipedia

Radio interface: The GSM radio link uses both FDMS & TDMA. Downlink->935-960 MHz & uplink 890-915 MHz Freq band is divided 124 pairs of duplex. Discontinues transmission is used in GSM to save the power consumption of MS. It turns on when present. It also supports discontinuous reception where MS needs to listen only. The length is divided into eight burst of length 0.577.
