If we know that an option loses value over time, we can use Theta to approximate how much value it loses each day. Now, let's define each Greek in more detail. Delta: The hedge ratio. The first Greek is Delta, which measures how much an option's price is expected to change per \$1 change in the price of the underlying security or index. For example, a Delta of 0.40 means that the option's price will theoretically move \$0.40 for every \$1 move in the price of the underlying stock or index.
